Test 3 Distribution of Scores

The class average on this test was 63, and 16 students (11%) scored 90 or higher. While the overall class performance is fine, I continue to be troubled by the number of low scores. 39 students (26%) scored below 50. I urge you all to review the material on this test—both the routine things as in problems 1 and 2, but the more subtle applications as in problems 3 and 4. Rather than memorizing formulas you should visualize the physical situation and think the problem through carefully. Test 4 will include an application of the type studied in Chapter 6.
