Math 1553 Supplement, Chapter 7

- **1.** True or false. If the statement is always true, answer true. Otherwise, answer false. Justify your answer.
 - a) Suppose $W = \text{Span}\{w\}$ for some vector $w \neq 0$, and suppose v is a vector orthogonal to w. Then the orthogonal projection of v onto W is the zero vector.
 - **b)** Suppose *W* is a subspace of \mathbb{R}^n and *x* is a vector in \mathbb{R}^n . If *x* is not in *W*, then $x x_W$ is not zero.
 - c) Suppose W is a subspace of \mathbb{R}^n and x is in both W and W^{\perp} . Then x = 0.
 - **d)** Suppose \hat{x} is a least squares solution to Ax = b. Then \hat{x} is the closest vector to *b* in the column space of *A*.

Solution.

- **a)** True. Since $v \in W^{\perp}$, its projection onto W is zero.
- **b)** True. If x is not in W then $x \neq x_W$, so $x x_W$ is not zero.
- c) True. Since x is in W and W^{\perp} it is orthogonal to itself, so $||x||^2 = x \cdot x = 0$. The length of x is zero, which means every entry of x is zero, hence x = 0.
- **d)** False: $A\hat{x}$ is the closest vector to *b* in Col *A*.

2. Let
$$W = \text{Span}\{v_1, v_2\}$$
, where $v_1 = \begin{pmatrix} -1 \\ 2 \\ 1 \end{pmatrix}$ and $v_2 = \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$.
a) Find the closest point w in W to $x = \begin{pmatrix} 0 \\ 14 \\ -4 \end{pmatrix}$.
Let $A = \begin{pmatrix} -1 & 1 \\ 2 & 2 \\ 1 & 3 \end{pmatrix}$. We solve $A^T A v = A^T x$.
 $A^T A = \begin{pmatrix} 6 & 6 \\ 6 & 14 \end{pmatrix}$ $A^T \begin{pmatrix} 0 \\ 14 \\ -4 \end{pmatrix} = \begin{pmatrix} 24 \\ 16 \end{pmatrix}$.
We find $\begin{pmatrix} 6 & 6 \\ 6 & 14 \\ 16 \end{pmatrix} \xrightarrow{\text{RREF}} \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ -1 \end{pmatrix}$, so $v = \begin{pmatrix} 5 \\ -1 \end{pmatrix}$ and therefore
 $w = Av = \begin{pmatrix} -1 & 1 \\ 2 & 2 \\ 1 & 3 \end{pmatrix} \begin{pmatrix} 5 \\ -1 \end{pmatrix} = \begin{pmatrix} -6 \\ 8 \\ 2 \end{pmatrix}$.

b) Find the distance from *w* to $\begin{pmatrix} 0\\ 14\\ -4 \end{pmatrix}$.

$$||x - w|| = \left| \left| \begin{pmatrix} 0 \\ 14 \\ -4 \end{pmatrix} - \begin{pmatrix} -6 \\ 8 \\ 2 \end{pmatrix} \right| = \left| \left| \begin{pmatrix} 6 \\ 6 \\ -6 \end{pmatrix} \right| = \sqrt{36 + 36 + 36} = \sqrt{108} = 6\sqrt{3}.$$

c) Find the standard matrix for the orthogonal projection onto $\text{Span}\{v_1\}$.

$$B = \frac{1}{\nu_1 \cdot \nu_1} \nu_1 \nu_1^T = \frac{1}{(-1)^2 + 2^2 + 1^2} \begin{pmatrix} -1 \\ 2 \\ 1 \end{pmatrix} \begin{pmatrix} -1 & 2 & 1 \end{pmatrix} = \frac{1}{6} \begin{pmatrix} 1 & -2 & -1 \\ -2 & 4 & 2 \\ -1 & 2 & 1 \end{pmatrix}$$

d) Find the standard matrix for the orthogonal projection onto *W*.

Let $A = \begin{pmatrix} -1 & 1 \\ 2 & 2 \\ 1 & 3 \end{pmatrix}$. Since the columns of *A* are linearly independent, our pro-

jection matrix is $A(A^TA)^{-1}A^T$. We already computed A^TA in part (a), so our matrix is

$$A(A^{T}A)^{-1}A^{T} = \begin{pmatrix} -1 & 1\\ 2 & 2\\ 1 & 3 \end{pmatrix} \begin{pmatrix} 6 & 6\\ 6 & 14 \end{pmatrix}^{-1} \begin{pmatrix} -1 & 2 & 1\\ 1 & 2 & 3 \end{pmatrix} = \begin{pmatrix} -1 & 1\\ 2 & 2\\ 1 & 3 \end{pmatrix} \begin{pmatrix} 6 & 6\\ 6 & 14 \end{pmatrix}^{-1} \begin{pmatrix} -1 & 2 & 1\\ 1 & 2 & 3 \end{pmatrix}$$
$$= \frac{1}{48} \begin{pmatrix} -1 & 1\\ 2 & 2\\ 1 & 3 \end{pmatrix} \begin{pmatrix} 14 & -6\\ -6 & 6 \end{pmatrix} \begin{pmatrix} -1 & 2 & 1\\ 1 & 2 & 3 \end{pmatrix} = \frac{1}{3} \begin{pmatrix} 2 & -1 & 1\\ -1 & 2 & 1\\ 1 & 1 & 2 \end{pmatrix}.$$
