## Chapter 2

## Systems of Linear Equations: Algebra

## Section 2.1

## Systems of Linear Equations

## Line, Plane, Space, ...

Recall that $\mathbf{R}$ denotes the collection of all real numbers, i.e. the number line. It contains numbers like $0,-1, \pi, \frac{3}{2}, \ldots$

## Definition

Let $n$ be a positive whole number. We define

$$
\mathbf{R}^{n}=\text { all ordered } n \text {-tuples of real numbers }\left(x_{1}, x_{2}, x_{3}, \ldots, x_{n}\right) \text {. }
$$

## Example

When $n=1$, we just get $\mathbf{R}$ back: $\mathbf{R}^{1}=\mathbf{R}$. Geometrically, this is the number line.

## Line, Plane, Space, ...

## Continued

## Example

When $n=2$, we can think of $\mathbf{R}^{2}$ as the plane. This is because every point on the plane can be represented by an ordered pair of real numbers, namely, its $x$ and $y$-coordinates.

We can use the elements of $\mathbf{R}^{2}$ to label points on the plane, but $\mathbf{R}^{2}$ is not defined to be the plane!

## Line, Plane, Space, ...

## Continued

## Example

When $n=3$, we can think of $\mathbf{R}^{3}$ as the space we (appear to) live in. This is because every point in space can be represented by an ordered triple of real numbers, namely, its $x-, y$-, and $z$-coordinates.

Again, we can use the elements of $\mathbf{R}^{3}$ to label points in space, but $\mathbf{R}^{3}$ is not defined to be space!

## Line, Plane, Space, ...

## Example

All colors you can see can be described by three quantities: the amount of red, green, and blue light in that color. So we could also think of $\mathbf{R}^{3}$ as the space of all colors:

$$
\mathbf{R}^{3}=\text { all colors }(r, g, b)
$$

Again, we can use the elements of $\mathbf{R}^{3}$ to label the colors, but $\mathbf{R}^{3}$ is not defined to be the space of all colors!

## Line, Plane, Space, ...

So what is $\mathbf{R}^{4}$ ? or $\mathbf{R}^{5}$ ? or $\mathbf{R}^{n}$ ?
$\ldots$ go back to the definition: ordered $n$-tuples of real numbers

$$
\left(x_{1}, x_{2}, x_{3}, \ldots, x_{n}\right) .
$$

They're still "geometric" spaces, in the sense that our intuition for $\mathbf{R}^{2}$ and $\mathbf{R}^{3}$ sometimes extends to $\mathbf{R}^{n}$, but they're harder to visualize.
Last time we could have used $\mathbf{R}^{4}$ to label the amount of traffic $(x, y, z, w)$ passing through four streets.

We'll make definitions and state theorems that apply to any $\mathbf{R}^{n}$, but we'll only draw pictures for $\mathbf{R}^{2}$ and $\mathbf{R}^{3}$.

## One Linear Equation

What does the solution set of a linear equation look like?
$x+y=1$ mu $\rightarrow$ a line in the plane: $y=1-x$ This is called the implicit equation of the line.

We can write the same line in parametric form in $\mathbf{R}^{2}$ :

$$
(x, y)=(t, 1-t) \quad t \text { in } \mathbf{R}
$$

This means that every point on the line has the form $(t, 1-t)$ for some real number $t$.

## Aside

What is a line? A ray that is straight and infinite in both directions.

## One Linear Equation

What does the solution set of a linear equation look like?

Does this plane have a parametric form?

$$
(x, y, z)=(t, w, 1-t-w) \quad t, w \text { in } \mathbf{R}
$$

Note: we are labeling the points on the plane by elements $(t, w)$ in $\mathbf{R}^{2}$.

Aside
What is a plane? A flat sheet of paper that's infinite in all directions.

## One Linear Equation

What does the solution set of a linear equation look like?

$$
x+y+z+w=1 \text { mu a "3-plane" in "4-space"... [not pictured here] }
$$

Is the plane from the previous example equal to $\mathbf{R}^{2}$ ?
A. Yes
B. No

No! Every point on this plane is in $\mathbf{R}^{3}$ : that means it has three coordinates. For instance, $(1,0,0)$. Every point in $\mathbf{R}^{2}$ has two coordinates. But we can label the points on the plane by $\mathbf{R}^{2}$.

## Systems of Linear Equations

What does the solution set of a system of more than one linear equation look like?

$$
\begin{aligned}
& x-3 y=-3 \\
& 2 x+y=8
\end{aligned}
$$

. . . is the intersection of two lines, which is a point in this case.

In general it's an intersection of lines, planes, etc.
[two planes intersecting]

## Kinds of Solution Sets

In what other ways can two lines intersect?

$$
\begin{aligned}
& x-3 y=-3 \\
& x-3 y=3
\end{aligned}
$$

has no solution: the lines are parallel.

A system of equations with no solutions is called inconsistent.

## Kinds of Solution Sets

In what other ways can two lines intersect?

$$
\begin{array}{r}
x-3 y=-3 \\
2 x-6 y=-6
\end{array}
$$

has infinitely many solutions: they are the same line.

Note that multiplying an equation by a nonzero number gives the same solution set. In other words, they are equivalent (systems of) equations.

## Summary

- $\mathbf{R}^{n}$ is the set of ordered lists of $n$ numbers.
- $\mathbf{R}^{n}$ can be used to label geometric objects, like $\mathbf{R}^{2}$ can label points in the plane.
- The solutions of a system equations look like an intersection of lines, planes, etc.
- Finding all the solutions means finding a parametric form of the system of equations.
