Beamer + Inkscape = :-)
Hello world!

- make a title page
- use a theme
- use a colorscheme
  - don’t micromanage the theme / colors
There are alternatives to Beamer:

- Keynote
- Prezi
- Powerpoint?!?

But . . .

**Theorem (−)**

*Beamer is the best!*
It’s good to use bullet points
Clicking through

- It’s good to use bullet points
- \texttt{\textbackslash pause} puts a break in the frame
Clicking through

- It's good to use bullet points
- \pause puts a break in the frame
- \item\textless{}n-m\textgreater{} makes the item appear on slides \textit{\textless{}n-m\textgreater{}} of the frame
Clicking through

- It’s good to use bullet points
- \pause puts a break in the frame
- \item\langle n-m\rangle makes the item appear on slides n-m of the frame
- \visible\langle n-m\rangle\{...\} does the same for anything in the \{\}'s
Clicking through

- It's good to use bullet points
- `\pause` puts a break in the frame
- `\item<n-m>` makes the item appear on slides n-m of the frame
- `\visible<n-m>{...}` does the same for anything in the `{}`'s
- `\onslide<n-m>{...}` is the same?
Clicking through

- It's good to use bullet points
- `\pause` puts a break in the frame
- `\item<n-m>` makes the item appear on slides n–m of the frame
- `\visible<n-m>{...}` does the same for anything in the `{}`'s
- `\onslide<n-m>{...}` is the same?
- `\uncover<n-m>{...}` is similar but text is shaded depending on settings
Clicking through

- It’s good to use bullet points
- \pause puts a break in the frame
- \item<n-m> makes the item appear on slides n–m of the frame
- \visible<n-m>{...} does the same for anything in the {}’s
- \onslide<n-m>{...} is the same?
- \uncover<n-m>{...} is similar but text is shaded depending on settings
- \only<n-m>{...} is similar
  - but {...} **doesn’t exists** except on slides n–m
Clicking through

- It’s good to use bullet points
- \pause puts a break in the frame
- \item\(<n-m> makes the item appear on slides n-m of the frame
- \visible\(<n-m>\{...\} does the same for anything in the \{\}'s
- \onslide\(<n-m>\{...\} is the same?
- \uncover\(<n-m>\{...\} is similar but text is shaded depending on settings
- \only\(<n-m>\{...\} is similar
  - but \{...\} doesn’t exist except on slides n-m
- ranges <n->, <-n> work too
Clicking through

- It’s good to use bullet points
- \textbackslash pause puts a break in the frame
- \textbackslash item\langle n-m\rangle makes the item appear on slides \textbackslash n-m of the frame
- \textbackslash visible\langle n-m\rangle\{\ldots\} does the same for anything in the \{\}’s
- \textbackslash onslide\langle n-m\rangle\{\ldots\} is the same?
- \textbackslash uncover\langle n-m\rangle\{\ldots\} is similar but text is shaded depending on settings
- \textbackslash only\langle n-m\rangle\{\ldots\} is similar
  - but \{\ldots\} \textbf{doesn’t exist} except on slides \textbackslash n-m
- ranges \langle n->, \langle -n\rangle work too

These things work in equations too:

\[ a^2 + b^2 = c^2 \]
It’s good to use bullet points
\pause puts a break in the frame
\item\<n-m> makes the item appear on slides \text{n-m} of the frame
\visible\<n-m>\{...\} does the same for anything in the \{\}\’s
\onslide\<n-m>\{...\} is the same?
\uncover\<n-m>\{...\} is similar but text is shaded depending on settings
\only\<n-m>\{...\} is similar
  \text{ but } \{...\} \text{ doesn’t exists} except on slides \text{n-m}
  \text{ ranges } \langle n-\rangle, \langle -n\rangle \text{ work too}

These things work in equations too:

$$3^2 + 4^2 = 5^2,$$ which can be changed
Clicking through

- It's good to use bullet points
- `\pause` puts a break in the frame
- `\item<n-m>` makes the item appear on slides $n-m$ of the frame
- `\visible<n-m>{...}` does the same for anything in the `{}`'s
- `\onslide<n-m>{...}` is the same?
- `\uncover<n-m>{...}` is similar but text is shaded depending on settings
- ranges $<n>$, $<-n>$ work too

These things work in equations too:

$$3^2 + 4^2 = 5^2,$$
which can be changed.
I use Inkscape for pictures – it’s open source and awesome

“Inkpad” exists for iPad

Let’s make a picture:

And labels!

use pinlabel

and labelpin

Spencer Dowdall (UIUC)
Including pictures

- I use Inkscape for pictures – it’s open source and awesome
  - “Inkpad” exists for iPad
- alternatives exit (like Xfig)
I use Inkscape for pictures – it’s open source and awesome
   “Inkpad” exists for iPad
alternatives exit (like Xfig)... but are inferior
TikZ (programming based drawing) is really good too

Tikz is a latex package that lets you programatically draw graphics (i.e., it compiles your code into pictures). Here’s an example of what TikZ can do:
