

Math 4432 - Spring 2017

Homework 1

Work all these problems and talk to me if you have any questions on them, but carefully write up and turn in **only** problems 1, 2, 3, 6, 11, 12, 13, and 14. **Due: January 24**

1. Compute the Alexander polynomial of the figure eight knot.
2. Show the figure eight knot is not 3 colorable.
3. Find all the topologies on the set $\{a, b, c\}$. Which are homeomorphic.

Let (X, \mathcal{T}) be a topological space and $A \subset X$. The **subspace topology** on A is the topology on A defined by $\mathcal{T}_A = \{U \cap A | U \in \mathcal{T}\}$.

4. Show \mathcal{T}_A is a topology on A .

This is not a homework problem but the following fact is useful and I encourage you to think about why it is true.

Fact: If \mathcal{B} is a basis for \mathcal{T} show that $\mathcal{B}_A = \{U \cap A | U \in \mathcal{B}\}$ is a basis for \mathcal{T}_A .

5. Let \mathbb{R} be the x -axis in \mathbb{R}^2 . Show the subspace topology on \mathbb{R} is the same as the standard topology on \mathbb{R} defined in class.

Let (X, \mathcal{T}) and (Y, \mathcal{T}') be two topological spaces. Set $\mathcal{B} = \{U \times V | U \in \mathcal{T} \text{ and } V \in \mathcal{T}'\}$.

6. Show \mathcal{B} is a basis for a topology on $X \times Y$. This is called the **product topology**.
7. Show the product topology on $\mathbb{R}^2 = \mathbb{R} \times \mathbb{R}$ is the same as the standard topology on \mathbb{R}^2 .
8. The product of two Hausdorff spaces is Hausdorff.
9. If $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are continuous maps then show that $g \circ f : X \rightarrow Z$ is a continuous map.
10. Show the projection onto either factor of a product space is continuous. That is show the maps $X \times Y \rightarrow X : (x, y) \mapsto x$ and $X \times Y \rightarrow Y : (x, y) \mapsto y$ are continuous.
11. Given a map $f : Z \rightarrow X \times Y$ you can always think of it as defined by $f(z) = (g(z), h(z))$ where $g : Z \rightarrow X$ and $h : Z \rightarrow Y$. Show that f is continuous if and only if g and h are both continuous.
12. Finite sets in a Hausdorff space are closed.
Hint: First prove that sets with one point in them are closed.

A topological space X is called **2nd countable** if it has a countable basis.

A set A in a topological space X is said to be **dense** in X if $\overline{A} = X$.

A topological space X is said to be **separable** if it has a countable dense subset.

13. Show a set A in X is dense if and only if every non-empty set in a basis for the topology of X contains a point of A .
14. Show a 2nd countable space X is 1st countable and separable.
