# WEIGHTED MARKOV-BERNSTEIN INEQUALITIES FOR ENTIRE FUNCTIONS OF EXPONENTIAL TYPE 

DORON S. LUBINSKY ${ }^{1}$

$$
\begin{aligned}
& \text { Abstract. We prove weighted Markov-Bernstein inequalities of the form } \\
& \qquad \int_{-\infty}^{\infty}\left|f^{\prime}(x)\right|^{p} w(x) d x \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(x)|^{p} w(x) d x
\end{aligned}
$$

Here $w$ satisfies certain doubling type properties, $f$ is an entire function of exponential type $\leq \sigma, p>0$, and $C$ is independent of $f$ and $\sigma$. For example, $w(x)=\left(1+x^{2}\right)^{\alpha}$ satisfies the condtions for any $\alpha \in \mathbb{R}$. Classical doubling inequalities of Mastroianni and Totik inspired this result.
Entire functions of exponential type, Bernstein inequalities 42C05 In honor of the retirement of Giuseppe Mastroianni

## 1. Introduction ${ }^{1}$

The classical Markov-Bernstein inequality for the unit circle asserts that for polynomials $P$ of degree $\leq n$, and $0<p \leq \infty$,

$$
\begin{equation*}
\left\|P^{\prime}\right\|_{L_{p}(\Gamma)} \leq n\|P\|_{L_{p}(\Gamma)} . \tag{1.1}
\end{equation*}
$$

Here $\Gamma$ is the unit circle, and if $p<\infty$,

$$
\|P\|_{L_{p}(\Gamma)}=\left(\int_{-\pi}^{\pi}\left|P\left(e^{i \theta}\right)\right|^{p} d \theta\right)^{1 / p} .
$$

Of course, it was earlier proved for $1 \leq p \leq \infty$, and later for $0<p<1$, by Arestov [1]. There is a close cousin for entire functions $f$ of exponential type $\leq \sigma$, and $0<p \leq \infty$ :

$$
\begin{equation*}
\left\|f^{\prime}\right\|_{L_{p}(\mathbb{R})} \leq \sigma\|f\|_{L_{p}(\mathbb{R})} . \tag{1.2}
\end{equation*}
$$

It too was earlier proved for $1 \leq p \leq \infty$, and later for $0<p<1$. See [15]. In fact, these inequalities are equivalent, and can be derived from each other - as follows, for example, from the methods of [10] where there is a similar equivalence between Marcinkiewicz-Zygmund and Plancherel-Polya inequalities. These are yet more illustrations of the classical link between approximation theory for polynomials and that for entire functions of exponential type, amply explored in the memoir of Ganzburg [8], and in the books of Timan [17], and Trigub and Belinsky [18], for example.

There is a vast literature on Markov-Bernstein inequalities, both for polynomials [5], [12], [14], and entire functions of exponential type. For the latter, there are Szegő type inequalities, and sharp inequalities for various subclasses of entire functions with special properties - see [4], [6], [16]. In another direction, weighted Bernstein

[^0]inequalities involving inner functions, and model spaces have been investigated by Baranov [2], [3].

For polynomials, one of the most beautiful results involves doubling weights, and is due to Mastroianni and Totik [13]. Recall the setting: let $W:[-\pi, \pi] \rightarrow[0, \infty)$ be measurable. Extend $W$ as a $2 \pi$ periodic function to the real line. We say that $W$ is doubling if there is a constant $L$ (called a doubling constant for $W$ ) such that for all intervals $I$, we have

$$
\int_{2 I} W \leq L \int_{I} W
$$

Here $2 I$ is the interval with the same center as $I$, but with twice the length. A typical doubling weight is

$$
W(t)=h(t) \prod_{j=1}^{k}\left|t-\beta_{j}\right|^{\gamma_{j}}
$$

where $h$ is bounded above and below by positive constants, and all $\left\{\beta_{j}\right\}$ are distinct and lie in $[-\pi, \pi]$, while all $\gamma_{j}>-1$. An immediate consequence of Theorem 4.1 in [13, p. 45] is that for $1 \leq p<\infty$,

$$
\int_{-\pi}^{\pi}\left|P^{\prime}\left(e^{i \theta}\right)\right|^{p} W(\theta) d \theta \leq C n^{p} \int_{-\pi}^{\pi}\left|P^{\prime}\left(e^{i \theta}\right)\right|^{p} W(\theta) d \theta
$$

valid for $n \geq 1$ and all polynomials $P$ of degree $\leq n$. This was extended to $0<p<1$ by Erdelyi [7]. The constant $C$ depends only on $p$ and the doubling constant $L$, not on the particular $W$.

In this paper, inspired by the results of Mastroanni, Totik, and Erdelyi, we prove weighted Markov-Bernstein inequalities. Our most general result follows:

## Theorem 1

Let $\sigma, p>0, r \in(0,1]$, and let $w: \mathbb{R} \rightarrow[0, \infty)$ be a measurable function satisfying the following:
(I) The one-sided doubling condition about 0: there exists $L>1$, such that for $|a| \geq r$,

$$
\begin{equation*}
\left|\int_{a}^{2 a} w\right| \leq L\left|\int_{a / 2}^{a} w\right| \tag{1.3}
\end{equation*}
$$

(II) The growth condition about integers: there exist $B, \beta \geq 1$ such that for $k \geq 0$ and $-1 \leq j \leq \max \left\{2 k+1, \frac{1}{r}\right\}$,

$$
\begin{equation*}
\int_{j r}^{j r+r} w \leq B(1+r|j-k|)^{\beta} \int_{k r}^{k r+r} w \tag{1.4}
\end{equation*}
$$

Assume also the analogous condition for $k<0$. For $t \in \mathbb{R}$, let

$$
\begin{equation*}
w_{r}(t)=\frac{1}{2 r} \int_{t-r}^{t+r} w(s) d s \tag{1.5}
\end{equation*}
$$

Then for entire functions $f$ of exponential type $\leq \sigma$, we have

$$
\begin{equation*}
\int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p} w_{r}(t) d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p} w_{r}(t) d t \tag{1.6}
\end{equation*}
$$

provided the right-hand side is finite. Here $C$ depends on $B, \beta, p$ and $L$, but is independent of $\sigma, r, f$, and the particular $w$.

## Corollary 2

Let $p>0$. Assume that all the conditions of Theorem 1 hold for some $r_{0} \in(0,1)$, and all $r \in\left(0, r_{0}\right)$, with $L, B$ and $\beta$ independent of $r$. Then for $\sigma>0$, and entire functions $f$ of exponential type $\leq \sigma$, we have

$$
\begin{equation*}
\int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p} w(t) d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p} w(t) d t \tag{1.7}
\end{equation*}
$$

provided the right-hand side is finite. Here $C$ depends on $B, \beta$ and $L$, but is independent of $\sigma, f$, and the particular $w$.

## Corollary 3

Let $\sigma, p>0$, and let $w: \mathbb{R} \rightarrow(0, \infty)$ be a measurable function satisfying the following: for some $M \geq 1$, we have for both $\frac{1}{2} \leq \frac{s}{t} \leq 2$ and $|s-t| \leq 2$,

$$
\begin{equation*}
\frac{1}{M} \leq w(s) / w(t) \leq M, \text { for } t \in \mathbb{R} \backslash\{0\} \tag{1.8}
\end{equation*}
$$

Then for entire functions $f$ of exponential type $\leq \sigma$, we have

$$
\begin{equation*}
\int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p} w(t) d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p} w(t) d t \tag{1.9}
\end{equation*}
$$

provided the right-hand side is finite. Here $C$ depends on $M$, but is independent of $\sigma, w$ and $f$.

## Corollary 4

Let $\sigma, p>0$, and $\alpha \in \mathbb{R}$. Then for entire functions $f$ of exponential type $\leq \sigma$, we have

$$
\begin{equation*}
\int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p}\left(1+t^{2}\right)^{\alpha} d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p}\left(1+t^{2}\right)^{\alpha} d t \tag{1.10}
\end{equation*}
$$

provided the right-hand side is finite. Here $C$ is independent of $\sigma$ and $f$.
To the best of our knowledge, even the inequalities in Corollary 4 are new. Almost all existing inequalities in the literature are unweighted, though they involve sharp constants as in (1.2). We note that if $1=\lambda_{1}<\lambda_{2}<\ldots$, and $f(x)=$ $\sum_{j=1}^{m} c_{j} \lambda_{j}^{-i x}$, we used orthogonal Dirichlet polynomials in [11] to prove

$$
\left(\int_{-\infty}^{\infty} \frac{\left|f^{\prime}(x)\right|^{2}}{1+x^{2}} d x\right)^{1 / 2} \leq\left\{\log \lambda_{m}+\left(\log \lambda_{m}\right)^{1 / 2}\right\}\left(\int_{-\infty}^{\infty} \frac{|f(x)|^{2}}{1+x^{2}} d x\right)^{1 / 2}
$$

Here one cannot replace $\log \lambda_{m}+\left(\log \lambda_{m}\right)^{1 / 2}$ by any factor smaller than $\log \lambda_{m}+C_{1}$ for some $C_{1}>0$. This inequality reflects the fact that $f$ is entire of type $\leq \log \lambda_{m}$.

We prove the results in Section 2. Throughout, $C, C_{1}, C_{2}, \ldots$ denote positive constants independent of $f, \sigma, r$. The same symbol does not necessarily denote the same constant in different occurrences.

## 2. Proof of The Results

Throughout, we let

$$
S(t)=\frac{\sin \pi t}{\pi t}
$$

denote the sinc kernel. We'll use the bounds $|S(t)| \leq \min \left\{1, \frac{1}{\pi|t|}\right\}$. We begin by applying (1.2) to

$$
\begin{equation*}
g(t)=f(t)\left[S\left(\frac{t}{\ell}\right)+i S\left(\frac{t}{\ell}+\frac{1}{2}\right)\right]^{\ell} \tag{2.1}
\end{equation*}
$$

where $\ell$ is a fixed positive integer. This yields:

## Lemma 2.1

Let $\ell \geq 1, p>0$, and $f$ be entire of exponential type $\leq \sigma$. Then

$$
\begin{equation*}
\int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p}(1+|t|)^{-\ell p} d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p}(1+|t|)^{-\ell_{p}} d t \tag{2.2}
\end{equation*}
$$

where $C$ is independent of $f$ and $\sigma$.
Proof
Let

$$
h(t)=S\binom{t}{\ell}+i S\left(\frac{t}{\ell}+\frac{1}{2}\right)
$$

so that $g(t)=f(t) h(t)^{\ell}$. First note that for real $t$,

$$
\begin{equation*}
|h(t)| \leq \min \left\{2, \frac{\ell}{\pi|t|}+\frac{\ell}{\pi(|t|+\ell / 2)}\right\} \leq C(1+|t|)^{-1} \tag{2.3}
\end{equation*}
$$

where $C$ depends only on $\ell$. By (1.2), and some simple calculations, also,

$$
\begin{equation*}
\left|h^{\prime}(t)\right| \leq C(1+|t|)^{-1} \tag{2.4}
\end{equation*}
$$

where again $C$ depends only on $\ell$. In the other direction, we see that

$$
\begin{align*}
|h(t)|^{2} & =\left(\frac{\sin \pi \frac{t}{\ell}}{\pi \frac{t}{\ell}}\right)^{2}+\left(\frac{\cos \pi \frac{t}{\ell}}{\pi\left(\frac{t}{\ell}+\frac{1}{2}\right)}\right)^{2} \\
& \geq \frac{\left(\sin \pi \frac{t}{\ell}\right)^{2}+\left(\cos \pi \frac{t}{\ell}\right)^{2}}{\left(\pi\left(\left|\frac{t}{\ell}\right|+\frac{1}{2}\right)\right)^{2}} \geq C(1+|t|)^{-2} \tag{2.5}
\end{align*}
$$

Then, recalling (2.1),

$$
\begin{align*}
\left|f^{\prime}(t) h(t)^{\ell}\right| & =\left|g^{\prime}(t)-f(t) \ell h(t)^{\ell-1} h^{\prime}(t)\right| \\
& \leq\left|g^{\prime}(t)\right|+C|f(t)|(1+|t|)^{-\ell} \tag{2.6}
\end{align*}
$$

by (2.3) and (2.4). Now $g$ is entire of exponential type $\leq \sigma+1$, and (2.3) shows that

$$
\int_{-\infty}^{\infty}|g(t)|^{p} d t \leq C \int_{-\infty}^{\infty}|f(t)|^{p}(1+|t|)^{-\ell p} d t<\infty
$$

so applying (1.2) to $g$ gives

$$
\int_{-\infty}^{\infty}\left|g^{\prime}(t)\right|^{p} d t \leq(\sigma+1)^{p} \int_{-\infty}^{\infty}|g(t)|^{p} d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p}(1+|t|)^{-\ell p} d t
$$

Together with (2.6), and (2.5), this yields

$$
\begin{aligned}
& \int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p}(1+|t|)^{-\ell p} d t \\
\leq & C \int_{-\infty}^{\infty}\left|f^{\prime}(t) h(t)^{\ell}\right|^{p} d t \\
\leq & C \int_{-\infty}^{\infty}\left(\left|g^{\prime}(t)\right|^{p}+C|f(t)|^{p}(1+|t|)^{-\ell p}\right) d t \\
\leq & C\left\{(\sigma+1)^{p}+1\right\} \int_{-\infty}^{\infty}|f(t)|^{p}(1+|t|)^{-\ell p} d t
\end{aligned}
$$

So we have the result.

From this we deduce:

## Lemma 2.2

Let $\sigma, p>0, \ell \geq 1$, and let $w: \mathbb{R} \rightarrow[0, \infty)$ be a measurable function. Let

$$
\begin{equation*}
H(t)=\int_{-\infty}^{\infty} \frac{w(x)}{(1+|x-t|)^{\ell p}} d x, t \in \mathbb{R} \tag{2.7}
\end{equation*}
$$

and assume that this is finite for $t \in \mathbb{R}$. Then for entire functions $f$ of exponential type $\leq \sigma$ for which the right-hand side is finite,

$$
\begin{equation*}
\int_{-\infty}^{\infty}\left|f^{\prime}(t)\right|^{p} H(t) d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(t)|^{p} H(t) d t \tag{2.8}
\end{equation*}
$$

where $C$ depends only on $\ell$ and $p$. In particular, it is independent of $f, \sigma, w, H$.

## Proof

For a given $x$, and $f$, apply Lemma 2.1 to the function $f(\cdot+x)$, so that we are translating the variable. Making a substitution $s=t+x$ yields

$$
\int_{-\infty}^{\infty}\left|f^{\prime}(s)\right|^{p} \frac{d s}{(1+|s-x|)^{\ell p}} \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty}|f(s)|^{p} \frac{d s}{(1+|s-x|)^{\ell p}}
$$

Now multiply by $w(x)$ and integrate over all real $x$, and then interchange the integrals. The convergence of the right-hand side in (2.8), and the non-negativity of the integrand justifies the interchange of integrals.

Our final lemma before proving Theorem 1 involves upper and lower bounds on $w_{r}$ :

## Lemma 2.3

Assume the hypotheses of Theorem 1. Then for some $C_{1}, C_{2}>0$ that depend on $L, B, \beta, \int_{-1}^{0} w, \int_{0}^{1} w$, but not on $r, t$, nor on the particular $w$,

$$
\begin{equation*}
C_{2}(1+|t|)^{-\beta} \leq w_{r}(t) \leq C_{1}(1+|t|)^{\log _{2} L} \tag{2.9}
\end{equation*}
$$

Proof
We first establish the lower bound. Let us assume first that $t \geq 0$ and choose $j_{0} \geq 0$ such that $j_{0} r \leq t \leq\left(j_{0}+1\right) r$. Note that then

$$
\begin{align*}
j_{0} r & \geq t-r \text { and }\left(j_{0}+1\right) r \leq t+r \\
\left(j_{0}-1\right) r & \leq t-r \text { and }\left(j_{0}+2\right) r \geq t+r . \tag{2.10}
\end{align*}
$$

Then, using (1.4),

$$
\begin{aligned}
\int_{t-r}^{t+r} w & \geq \int_{j_{0} r}^{\left(j_{0}+1\right) r} w \\
& \geq B^{-1}\left(1+j_{0} r\right)^{-\beta} \int_{0}^{r} w \\
& \geq B(1+t)^{-\beta} \int_{0}^{r} w \\
& \geq B(1+t)^{-\beta}\left(1+B\left(1+2^{\beta}\right)\right)^{-1} \int_{-r}^{r} w
\end{aligned}
$$

again by (1.4). Thus for $t \geq 0$, and some $C$ depending only on $B, \beta$,

$$
\begin{equation*}
w_{r}(t) \geq C(1+t)^{-\beta} w_{r}(0) \tag{2.11}
\end{equation*}
$$

Next, using (1.4),

$$
\begin{aligned}
\int_{0}^{1} w & \leq \sum_{j=0}^{\left[\frac{1}{r}\right]} \int_{j r}^{(j+1) r} w \\
& \leq B\left(\int_{0}^{r} w\right) \sum_{j=0}^{\left[\frac{1}{r}\right]}(1+j r)^{\beta} \\
& \leq B\left(\int_{0}^{r} w\right) \int_{0}^{\left[\frac{1}{r}\right]+1}(1+s r)^{\beta} d s \\
& =B\left(\frac{1}{r} \int_{0}^{r} w\right) \int_{0}^{r\left[\frac{1}{r}\right]+r}(1+y)^{\beta} d y \\
& \leq B\left(\frac{1}{r} \int_{0}^{r} w\right) \int_{0}^{2}(1+y)^{\beta} d y
\end{aligned}
$$

A similar estimate holds for $\int_{-1}^{0} w$, so for some $C$ depending only on $B, \beta$,

$$
\begin{equation*}
\int_{-1}^{1} w \leq C w_{r}(0) \tag{2.12}
\end{equation*}
$$

Together with (2.11), this establishes the lower bound for $t \geq 0$, and of course $t<0$ is similar. We turn to the upper bound. Again, we assume $t \geq 0$, and that $j_{0}$ is as above. We see using (2.10), and then (1.4), that

$$
\begin{aligned}
\int_{t-r}^{t+r} w & \leq \int_{\left(j_{0}-1\right) r}^{\left(j_{0}+2\right) r} w \\
& \leq\left(1+2 B 2^{\beta}\right) \int_{j_{0} r}^{\left(j_{0}+1\right) r} w .
\end{aligned}
$$

We continue this using (1.4), as

$$
\begin{aligned}
& \leq\left(1+2^{\beta+1} B\right) \frac{1}{\left[\frac{1}{r}\right]+1} \sum_{k=j_{0}}^{j_{0}+\left[\frac{1}{r}\right]} B\left(1+\left|j_{0}-k\right| r\right)^{\beta} \int_{k r}^{(k+1) r} w \\
& \leq\left(1+2^{\beta+1} B\right) B 2^{\beta} r \int_{j_{0} r}^{\left(j_{0}+\left[\frac{1}{r}\right]+1\right) r} w .
\end{aligned}
$$

Thus we have shown that

$$
w_{r}(t) \leq C \int_{j_{0} r}^{j_{0} r+2} w
$$

where $C$ is independent of $r, t$, but depends on $B$ and $\beta$. We continue this using (2.10) as

$$
\begin{aligned}
& \leq C\left[\int_{0}^{1} w+\int_{1}^{t+2} w\right] \\
& \leq C\left[\int_{0}^{1} w+\sum_{0 \leq k \leq \log _{2}(t+2)} \int_{2^{k}}^{2^{k+1}} w\right] \\
& \leq C\left(\int_{0}^{1} w\right)\left[1+\sum_{0 \leq k \leq \log _{2}(t+2)} L^{k+1}\right] \\
& \leq C\left(\int_{0}^{1} w\right) L^{\log _{2}(t+2)} \\
& =C\left(\int_{0}^{1} w\right)(t+2)^{\log _{2} L}
\end{aligned}
$$

This gives the upper bound for $t \geq 0$, and the case $t<0$ is similar.

## Proof of Theorem 1

Choose $\ell$ so large that

$$
\begin{equation*}
\log _{2} L+\beta-\ell p \leq-2 \tag{2.13}
\end{equation*}
$$

Note that this choice does not depend on $w$. Let $H$ be as in Lemma 2.2. We estimate $H$ above and below. Let us assume first that $t \geq 0$ and choose $j_{0} \geq 0$ such that $j_{0} r \leq t<\left(j_{0}+1\right) r$, so that (2.10) holds. Split

$$
\begin{align*}
H(t) & =\left(\int_{-\infty}^{0}+\int_{0}^{\max \left\{\left(2 j_{0}+1\right) r, 1\right\}}+\int_{\max \left\{\left(2 j_{0}+1\right) r, 1\right\}}^{\infty}\right) \frac{w(s)}{(1+|s-t|)^{\ell p}} d s \\
& =I_{1}+I_{2}+I_{3} . \tag{2.14}
\end{align*}
$$

We start with the central integral $I_{2}$ as it will contribute to both our upper and lower bounds. We use our growth condition (1.4) as well as that fact that for $s \in[j r,(j+1) r]$, we have $|s-t| \geq\left|j-j_{0}\right| r-r \geq \frac{1}{2}\left|j-j_{0}\right| r$ if $\left|j-j_{0}\right| \geq 2$. If
$\left|j-j_{0}\right| \leq 2$, observe that $\left|j-j_{0}\right| r \leq 2$. Thus

$$
\begin{align*}
I_{2} & \leq \sum_{j=0}^{\max \left\{2 j_{0}+1,\left[\frac{1}{r}\right]\right\}} \int_{j r}^{(j+1) r} \frac{w(s)}{(1+|s-t|)^{\ell p}} d s \\
& \leq \sum_{j=0}^{\max \left\{2 j_{0}+1,\left[\frac{1}{r}\right]\right\}} \frac{1}{\left(\frac{1}{4}\left(1+\left|j-j_{0}\right| r\right)\right)^{\ell p}} \int_{j r}^{(j+1) r} w(s) d s \\
& \leq 4^{\ell p} B\left(\int_{j_{0} r}^{\left(j_{0}+1\right) r} w(s) d s\right) \sum_{j=0}^{\max \left\{2 j_{0}+1,\left[\frac{1}{r}\right]\right\}} \frac{1}{\left(1+\left|j-j_{0}\right| r\right)^{\ell p-\beta}} \\
& \leq 4^{\ell p} B\left(\int_{t-r}^{t+r} w(s) d s\right) \sum_{k=-\infty}^{\infty} \frac{1}{(1+|k| r)^{\ell p-\beta}} \\
& \leq 4^{\ell p+3} B r w_{r}(t) \int_{-\infty}^{\infty} \frac{1}{(1+|s| r)^{\ell p-\beta}} d s \\
& \leq C_{1} w_{r}(t) . \tag{2.15}
\end{align*}
$$

Here $C_{1}$ depends on $B, \beta, \ell, p$ but is independent of $r$ and $w$. We have also used (2.13) and $L \geq 1$ to ensure the convergence of the integral in the second last line. Note that we could not simply use the upper bound in Lemma 2.3 for $w_{r}$, as we need the last right-hand side of $(2.15)$ to involve $w_{r}(t)$. In the other direction, we see from (1.4) that

$$
\begin{align*}
I_{2} & \geq \sum_{j=j_{0}}^{\max \left\{2 j_{0}+1,\left[\frac{1}{r}\right]\right\}} \frac{1}{\left(1+\left|j-j_{0}\right| r+r\right)^{\ell p}} \int_{j r}^{(j+1) r} w(s) d s \\
& \geq B^{-1}\left(\int_{j_{0} r}^{\left(j_{0}+1\right) r} w(s) d s\right)^{\max \left\{2 j_{0}+1,\left[\frac{1}{r}\right]\right\}} \sum_{j=j_{0}}^{\max \left\{j_{0}+1,\left[\frac{1}{r}\right]-j_{0}\right\}} \frac{1}{\left(2+\left|j-j_{0}\right| r\right)^{\ell p+\beta}} \frac{1}{(2+k r)^{\ell p+\beta}}
\end{align*}
$$

Here, using our growth condition (1.4), and then (2.10),

$$
\left(1+2 B 2^{\beta}\right) \int_{j_{0} r}^{\left(j_{0}+1\right) r} w(s) d s \geq \int_{\left(j_{0}-1\right) r}^{\left(j_{0}+2\right) r} w(s) d s \geq \int_{t-r}^{t+r} w(s) d s=2 r w_{r}(t)
$$

and

$$
\begin{aligned}
\sum_{k=0}^{\max \left\{j_{0}+1,\left[\frac{1}{r}\right]-j_{0}\right\}} \frac{1}{(2+k r)^{\ell p+\beta}} & \geq \frac{1}{2} \int_{0}^{\max \left\{j_{0}+1,\left[\frac{1}{r}\right]-j_{0}\right\}} \frac{1}{(2+t r)^{\ell p+\beta}} d t \\
& =\frac{1}{2 r} \int_{0}^{\max \left\{\left(j_{0}+1\right) r, r\left[\frac{1}{r}\right]-j_{0} r\right\}} \frac{1}{(2+s)^{\ell p+\beta}} d s \\
& \geq \frac{1}{2 r} \int_{0}^{1 / 2} \frac{1}{(2+s)^{\ell p+\beta}} d s
\end{aligned}
$$

since if $\left(j_{0}+1\right) r \leq \frac{1}{2}$, then $r\left[\frac{1}{r}\right]-j_{0} r \geq 1-r-j_{0} r \geq \frac{1}{2}$. Substituting the last two inequalities in (2.16), and using (2.15), we have shown that for $t \geq 0$,

$$
\begin{equation*}
C_{1} w_{r}(t) \geq I_{2} \geq C_{2} w_{r}(t) \tag{2.17}
\end{equation*}
$$

where $C_{1}$ and $C_{2}$ depend on $\ell, p, \beta, B$, but not on $r$ or the particular $w$. Next, our doubling condition (1.3) gives

$$
\begin{aligned}
& I_{1} \leq \sum_{j=0}^{\infty} \int_{-2^{j+1}}^{-2^{j}} \frac{w(s)}{(1+|s|+t)^{\ell p}} d s+\frac{1}{(1+t)^{\ell p}} \int_{-1}^{0} w \\
& \leq \sum_{j=0}^{\infty} \frac{1}{\left(1+2^{j}+t\right)^{\ell p}} \int_{-2^{j+1}}^{-2^{j}} w(s) d s+\frac{1}{(1+t)^{\ell p}} \int_{-1}^{0} w \\
& \leq \sum_{j=0}^{\infty} \frac{L^{j+1}}{\left(1+2^{j}+t\right)^{\ell p}} \int_{-1}^{0} w+\frac{1}{(1+t)^{\ell p}} \int_{-1}^{0} w \\
& \leq\left(\frac{1}{(1+t)^{\ell p}} \sum_{0 \leq j \leq \log _{2}(1+t)} L^{j+1}+L \sum_{j>\log _{2}(1+t)}\left(\frac{L}{2^{\ell p}}\right)^{j}+\frac{1}{(1+t)^{\ell p}}\right) \int_{-1}^{0} w \\
& \leq C\left(\frac{1}{(1+t)^{\ell p}} L^{\log _{2}(1+t)}+\left(\frac{L}{2^{\ell p}}\right)^{\log _{2}(1+t)}\right) \int_{-1}^{0} w \\
&(2.18) \leq C\left(\int_{-1}^{0} w\right)(1+t)^{\log _{2} L-\ell p}
\end{aligned}
$$

by (2.13). Here $C$ depends only on $p, \ell, L$. Next, let $N=\log _{2} \max \left\{\left[\left(2 j_{0}+1\right) r\right], 1\right\}$, and let $j \geq N$, and $s \in\left[2^{j}, 2^{j+1}\right]$. We claim that

$$
\begin{equation*}
1+|s-t| \geq \frac{1}{3} 2^{j} \tag{2.19}
\end{equation*}
$$

If first $j_{0}=0$, then $N=1$ and $t<r$, so $1+|s-t| \geq 1+2^{j}-1=2^{j}$. If $j_{0} \geq 1$, then $\left(j_{0}+1\right) r \leq \frac{2}{3}\left(2 j_{0}+1\right) r \leq \frac{2}{3} 2^{N}$, so $|s-t| \geq 2^{j}-\left(j_{0}+1\right) r \geq 2^{j}-\frac{2}{3} 2^{N} \geq \frac{1}{3} 2^{j}$.

Thus we have (2.19). Then our doubling hypothesis (1.3) gives

$$
\begin{aligned}
I_{3} & \leq \sum_{j=N}^{\infty} \int_{2^{j}}^{2^{j+1}} \frac{w(s)}{(1+|s-t|)^{\ell p}} d s \\
& \leq \sum_{j=N}^{\infty} \frac{1}{\left(3^{-1} 2^{j}\right)^{\ell p}} \int_{2^{j}}^{2^{j+1}} w(s) d s \\
& \leq \sum_{j=N}^{\infty} \frac{1}{\left(3^{-1} 2^{j}\right)^{\ell p}} L^{j+1} \int_{0}^{1} w \\
& \leq 3^{\ell p} L\left(\int_{0}^{1} w\right) \sum_{j=N}^{\infty}\left(\frac{L}{2^{\ell p}}\right)^{j} \\
& \leq(2) 3^{\ell p} L\left(\int_{0}^{1} w\right)\left(\frac{L}{2^{\ell p}}\right)^{N} \\
& \leq C\left(\int_{0}^{1} w\right)\left(\max \left\{\left[\left(2 j_{0}+1\right) r\right], 1\right\}\right)^{\log _{2} L-\ell p} \\
& \leq C\left(\int_{0}^{1} w\right)(1+t)^{\log _{2} L-\ell p} .
\end{aligned}
$$

In the third last line, we used $L / 2^{\ell p} \leq 1 / 4$, as follows from (2.13). In the last line, we used (2.10). Together with (2.14), (2.17), and (2.18), we have shown that for $t \geq 0$,

$$
C_{2} w_{r}(t) \leq H(t) \leq C_{1}\left(w_{r}(t)+\left(\int_{-1}^{1} w\right)(1+t)^{\log _{2} L-\ell p}\right)
$$

Next, from (2.11) and (2.12), we can continue this as

$$
\begin{aligned}
C_{2} w_{r}(t) & \leq H(t) \leq C_{1} w_{r}(t)\left(1+(1+t)^{\log _{2} L-\ell p+\beta}\right) \\
& \leq C_{3} w_{r}(t)
\end{aligned}
$$

by (2.13). The case $t<0$ is similar. Now the result follows from Lemma 2.2.
We note that at least for $p \geq 1$, one can use the Markov-Bernstein inequalities in Theorem 1 to prove that there exists $\delta_{0} \in(0,1)$ such that for $\sigma>0$, and nonidentically vanishing entire functions $f$ of exponential type $\leq \sigma$, we have

$$
\frac{1}{2} \leq \int_{-\infty}^{\infty}|f(t)|^{p} w_{\delta_{0} /(\sigma+1)}(t) d t / \int_{-\infty}^{\infty}|f(t)|^{p} w(t) d t \leq \frac{3}{2}
$$

This gives one way to prove Corollary 2. However, we use a different method below:

## Proof of Corollary 2

First note that Lemma 2.3 and our hypotheses imply that for some $C>1$,

$$
\begin{equation*}
C^{-1}(1+|t|)^{-\beta} \leq w_{r}(t) \leq C(1+|t|)^{\log _{2} L}, r \in\left(0, r_{0}\right) \text { and } t \in \mathbb{R} \tag{2.20}
\end{equation*}
$$

Here $C$ is independent of $r$ and $t$. Let $\sigma>0$ and $f$ be entire of type $\leq \sigma$, with the integral in the right-hand side of (1.7) finite. Let $k p \geq \beta+\log _{2} L+2, \varepsilon>0$ and

$$
g(t)=f(t) S(\varepsilon t)^{k}
$$

By Lebesgue's differentiation theorem, we have for a.e. $t \in \mathbb{R}$,

$$
\lim _{r \rightarrow 0+} w_{r}(t)|g(t)|^{p}=w(t)|g(t)|^{p}
$$

Next, (2.20) shows that for $r \in\left(0, r_{0}\right)$ and all real $t$

$$
\begin{aligned}
w_{r}(t)|g(t)|^{p} & \leq C(1+|t|)^{\log _{2} L}|f(t)|^{p} \min \left\{1, \frac{1}{\pi \varepsilon|t|}\right\}^{k p} \\
& \leq C_{1}(1+|t|)^{\log _{2} L-k p}|f(t)|^{p} \\
& \leq C_{1}(1+|t|)^{\log _{2} L-k p+\beta} w(t)|f(t)|^{p} \\
& \leq C_{1} C w(t)|f(t)|^{p}
\end{aligned}
$$

by Lemma 2.3 and our choice of $k$. Here $C_{1}$ and $C$ are independent of $r, f$ but depend on $\varepsilon$ and $w$. Since $C_{1} C w(t)|f(t)|^{p}$ is independent of $r$ and integrable by (1.7), Lebesgue's Dominated Convergence Theorem gives

$$
\lim _{r \rightarrow 0+} \int_{-\infty}^{\infty} w_{r}(t)|g(t)|^{p} d t=\int_{-\infty}^{\infty} w(t)|g(t)|^{p} d t
$$

Next, for each given $R>0$, as $g$ is bounded in each finite interval, and $w_{r}$ is bounded independently of $r$,

$$
\lim _{r \rightarrow 0+} \int_{-R}^{R} w_{r}(t)\left|g^{\prime}(t)\right|^{p} d t=\int_{-R}^{R} w(t)\left|g^{\prime}(t)\right|^{p} d t
$$

Then as $g$ has exponential type $\leq \sigma+k \varepsilon \pi$, Theorem 1 and the last two limits yield

$$
\begin{aligned}
& \int_{-R}^{R} w(t)\left|\frac{d}{d t}(f(t) S(\varepsilon t))\right|^{p} d t \\
\leq & C(\sigma+k \varepsilon \pi+1)^{p} \int_{-\infty}^{\infty} w(t)|f(t) S(\varepsilon t)|^{p} d t \\
\leq & C(\sigma+k \varepsilon \pi+1)^{p} \int_{-\infty}^{\infty} w(t)|f(t)|^{p} d t
\end{aligned}
$$

recall that $|S| \leq 1$. We can now let $\varepsilon \rightarrow 0+$, and use the fact that $S(\varepsilon t)$ converges uniformly for $t$ in compact subsets of $\mathbb{C}$ to $S(0)=1$. A similar statement then holds for the derivatives. We deduce that

$$
\int_{-R}^{R} w(t)\left|f^{\prime}(t)\right|^{p} d t \leq C(\sigma+1)^{p} \int_{-\infty}^{\infty} w(t)|f(t)|^{p} d t
$$

Finally, let $R \rightarrow \infty$.

## Proof of Corollary 3

We choose $r=1$ in Theorem 1. Our condition (1.8) shows that for some $C>1$ and all $t \in \mathbb{R}$,

$$
\begin{equation*}
M^{-1} \leq w_{1}(t) / w(t) \leq M \tag{2.21}
\end{equation*}
$$

That condition also gives for $a \geq 0$,

$$
\int_{a}^{2 a} w \leq M 2 a w(a) \leq 4 M^{2} \int_{a / 2}^{a} w
$$

and similarly,

$$
\int_{-2 a}^{a} w \leq 4 M^{2} \int_{-a / 2}^{0} w
$$

So we can choose $L=4 M^{2}$ in (1.3). Next, let $k \geq 0$ and $-1 \leq j \leq \max \left\{2 k+1, \frac{1}{r}\right\}=$ $2 k+1$. We have to show that (1.4) holds for the given $j, k$ and with $r=1$. Firstly if $j=-1$ or $0,(1.8)$ gives

$$
\begin{equation*}
\int_{j}^{j+1} w \leq M^{2} \int_{1}^{2} w \tag{2.22}
\end{equation*}
$$

So now let us consider $1 \leq j \leq 2 k+1$. Let us first suppose that $j \leq k$, and choose $0 \leq n \leq \log _{2} k$ such that

$$
\frac{k}{2^{n+1}} \leq j \leq \frac{k}{2^{n}}
$$

Then by repeated use of (1.8),

$$
\begin{align*}
\int_{j}^{j+1} w & \leq M w(j) \leq M^{2} w\left(\frac{k}{2^{n}}\right) \\
& \leq M^{n+2} w(k) \leq M^{n+3} \int_{k}^{k+2} w \tag{2.23}
\end{align*}
$$

Here

$$
\begin{aligned}
M^{n} & =2^{n \log _{2} M} \leq\left(\frac{k}{j}\right)^{\log _{2} M} \\
& =\left(1+\frac{k-j}{j}\right)^{\log _{2} M} \leq(1+|k-j|)^{\log _{2} M}
\end{aligned}
$$

Combined with (2.22) and (2.23), we have shown that for $-1 \leq j \leq k$,

$$
\int_{j}^{j+1} w \leq M^{5}(1+|k-j|)^{\log _{2} M} \int_{k}^{k+1} w
$$

Next, if $k<j \leq 2 k+1$,

$$
\begin{aligned}
\int_{j}^{j+1} w & \leq M^{2} w(k) \\
& \leq M^{3} \int_{k}^{k+1} w \leq M^{3}(1+|k-j|)^{\log _{2} M} \int_{k}^{k+1} w
\end{aligned}
$$

In summary, we have established (1.4) with $B=M^{5}$ and $\beta=\log _{2} M$. Then, recalling (2.21), Theorem 1.1 gives the result.

## Proof of Corollary 4

It is easy to see that $w(x)=\left(1+x^{2}\right)^{\alpha}$ satisfies (1.8), with, for example, $M=17^{|\alpha|}$.
