# Inclusion/Exclusion - Prelude

**Question** In the "Venn Diagram" shown below, the universe  $X$  contains 23 elements. There are 8 in the set  $A$  and 11 in  $B$ . If there are 5 in  $A \cap B$ , then how many elements of  $X$  belong to neither  $A$  nor  $B$ ?

# Inclusion/Exclusion - Prelude (2)

**Question** In the "Venn Diagram" shown below, the universe  $X$  contains 2307 elements. We want to determine the number of elements of  $X$  that don't belong to any of  $A$ ,  $B$  and  $C$ . If we know the number of elements in the following sets, can we do this?  $A$ ,  $B$ ,  $C$ ,  $A \cap B$ ,  $B \cap C$ ,  $A \cap C$ ,  $A \cap B \cap C$ .

# Inclusion/Exclusion (1)

**Notation** Let  $X$  be a set of objects and suppose that for every element  $i$  in  $\{1, 2, \dots, n\}$ , we have a property  $P_i$  so that for all  $x$  in  $X$ , the statement “ $x$  satisfies property  $P_i$ ” is either true or false ... but never ambiguous. Then for a subset  $S$  of  $\{1, 2, \dots, n\}$ , let  $N(S)$  be the subset of  $X$  consisting of all  $x$  in  $X$  which satisfy property  $P_i$  for all  $i$  in  $S$ . Note that  $N(\emptyset) = X$ .

**Notation** Let  $N_0$  be the subset of  $X$  consisting of those objects which satisfy **none** of the properties.

# Inclusion/Exclusion (2)

**Theorem** Let  $X$  be a set of objects and let  $P_i$  be a property for  $X$  for each  $i = 1, 2, \dots, n$ .  
Then:

$$N_0 = \sum_{S \subseteq \{1, 2, \dots, n\}} (-1)^{|S|} N(S)$$

**Example** When  $n = 2$ ,

$$N_0 = N(\emptyset) - N(1) - N(2) + N(1).$$

# Inclusion/Exclusion (3)

**Theorem** Let  $X$  be a set of objects and let  $P_i$  be a property for  $X$  for each  $i = 1, 2, \dots, n$ .  
Then:

$$N_0 = \sum_{S \subseteq \{1, 2, \dots, n\}} (-1)^{|S|} N(S)$$

**Example** When  $n = 3$ ,

$$\begin{aligned} N_0 &= N(\emptyset) \\ &\quad - N(1) - N(2) - N(3) \\ &\quad + N(12) + N(13) + N(23) \\ &\quad - N(123). \end{aligned}$$

# Inclusion/Exclusion (4)

**Example** When  $n = 4$ ,

$$N_0 = N(\emptyset)$$

$$- N(1) - N(2) - N(3) - N(4)$$

$$+ N(12) + N(13) + N(14) + N(23) + N(24) + N(34)$$

$$- N(123) - N(124) - N(134) - N(234)$$

$$+ N(1234).$$

# Inclusion/Exclusion (5)

**Observation** In general, there are  $2^n$  terms in the inclusion/exclusion formula. How can this possibly be of use?

**Conclusion** Inclusion/Exclusion may be of value when  $|N(S)|$  depends only on  $|S|$ . Also, it may be of value when there is some other form of “collapsing” among the exponentially many terms in the formula.

# Derangements

**Definition** A permutation  $\sigma$  of  $\{1, 2, \dots, n\}$  is called a derangement if  $\sigma(i) \neq i$  for all  $i = 1, 2, \dots, n$ .

**Example** 38754126 and 21436587 are derangements but 57314682 and 75318642 are not.

**Exercise** Write all derangements of  $\{1, 2, 3, 4, 5\}$ .

**Notation** Let  $d_n$  denote the number of derangements of  $\{1, 2, \dots, n\}$ .

# Derangements (2)

## Inclusion/Exclusion Formula for Derangements

$$\begin{aligned}d_n &= \sum_{S \subseteq \{1, 2, \dots, n\}} (-1)^{|S|} N(S) \\ &= \sum_{0 \leq k \leq n} (-1)^k C(n, k) (n - k)!\end{aligned}$$

**Explanation** When  $S$  is a subset of  $\{1, 2, \dots, n\}$  and  $|S| = k$ ,  $|N(S)| = (n - k)!$  To see this, note that if  $\sigma$  satisfies  $P_i$  and  $i$  belongs to  $S$ , then  $\sigma(i) = i$ . So the positions corresponding to elements of  $S$  are determined, and the other  $n - k$  positions are an arbitrary permutation of the remaining elements.

# Surjections (1)

**Notation** For an integer  $n$ , let  $[n]$  denote  $\{1, 2, \dots, n\}$ . Also, let  $S(n, m)$  denote the number of surjections from  $[n]$  to  $[m]$ .

**Exercise** Determine  $S(5, 3)$  by hand.

# Surjections (2)

## Inclusion/Exclusion Formula for Surjections

$$\begin{aligned}d_n &= \sum_{S \subseteq \{1, 2, \dots, n\}} (-1)^{|S|} N(S) \\ &= \sum_{0 \leq k \leq m} (-1)^k C(m, k) (m - k)^n\end{aligned}$$

**Explanation** When  $S$  is a subset of  $\{1, 2, \dots, m\}$  and  $|S| = k$ ,  $|N(S)| = (m - k)^n$ . To see this, note that if  $f$  satisfies  $P_i$  and  $i$  belongs to  $S$ , then  $i$  is not in the range of  $f$ . In other words,  $f$  is an function whose domain is  $[n]$  and whose range is a set of size  $m - k$ .

# The Euler $\varphi$ -function

**Notation** For an integer  $n \geq 2$ , let  $\varphi(n)$  denote the number of elements in  $[n]$  which are relatively prime to  $n$ .

**Example**  $\varphi(12) = 4$  since 1, 5, 7 and 11 are relatively prime to 12.

**Exercise** Compute  $\varphi(144)$ .

**Exercise** Compute  $\varphi(324481700624)$ .

# The Euler $\varphi$ -function

## Inclusion/Exclusion Formula for Euler $\varphi$ -Function

Suppose the prime factors of  $n$  are:  $p_1, p_2, \dots, p_k$ .

Then

$$\varphi(n) = n \left(1 - \frac{1}{p_1}\right) \left(1 - \frac{1}{p_2}\right) \dots \left(1 - \frac{1}{p_k}\right)$$

**Explanation** When  $m$  has the common prime factors  $p_3, p_7$  and  $p_8$  with  $n$ , then the number of such  $m$  is  $n/p_3p_7p_8$ .

# The Euler $\varphi$ -function

**Example** Compute  $\varphi(324481700624)$

Maple reports that

$$324481700624 = 2^4(109)(727)(255923)$$

Therefore

$$\begin{aligned}\varphi(324481700624) &= 324481700624(1-1/2)(1-1/109) \\ &\quad (1 - 1/727)(1 - 1/255923) \\ &= 2^3(108)(726)(255922) \\ &= 160530657408.\end{aligned}$$
