## Math 2551 A1 A2 A3 Exercise 2

Section:

Name:

Student Number:

- (1) Let  $\mathbf{r}$  be a point on the line passing two points  $\mathbf{A} = (1, 2, 1)$  and  $\mathbf{B} = (2, 1, -1)$ , then  $\mathbf{r}$  satisfies
- ✓ (a)  $\mathbf{r} - \mathbf{A} = t(\mathbf{B} - \mathbf{A})$ , for some  $t \in (-\infty, \infty)$ ;
  - (b)  $\mathbf{r} = t(\mathbf{A} - \mathbf{B})$ , for some  $t \in (-\infty, \infty)$ ;

- (2) A plane passes points  $\mathbf{A} = (1, 2, 1)$ ,  $\mathbf{B} = (2, 1, -1)$  and  $\mathbf{C} = (0, 0, 1)$ , which vector is perpendicular to the plane?
- (a)  $(\mathbf{A} \times \mathbf{C})$ ;
  - ✓ (b)  $(\mathbf{A} - \mathbf{B}) \times (\mathbf{C} - \mathbf{B})$ ;

(1) The line equation is  $\vec{r} - (\text{a point on the line})$   
 $= t (\text{a vector } \parallel \text{ to the line})$

Therefore only (a) satisfies the line equation, and (b) is missing a point on the line.

(2) Since  $\mathbf{A} - \mathbf{B}$  and  $\mathbf{C} - \mathbf{B}$  are  $\parallel$  to the plane,  $(\mathbf{A} - \mathbf{B}) \times (\mathbf{C} - \mathbf{B})$  gives a normal vector. On the other hand,  $\mathbf{A}$  or  $\mathbf{C}$  is not  $\parallel$  to the plane (even though their terminal points lie on the plane).
